

# Bird observations along the Noumbi River, Conkouati-Douli National Park, Congo-Brazzaville

José María Fernández-García<sup>a</sup>, Nerea Ruiz de Azua<sup>a</sup> and Rebeca Atencia<sup>b</sup>

**Observations ornithologiques au bord de la rivière Noumbi, Parc National de Conkouati-Douli, Congo-Brazzaville.** Un bref inventaire ornithologique de huit jours a été effectué en juillet 2013 le long de la rivière Noumbi, dans le Parc National de Conkouati-Douli, Zone Importante pour la Conservation des Oiseaux au sud-ouest du Congo-Brazzaville. Des 78 espèces enregistrées, huit n'avaient pas encore été observées dans le parc, dont une classée comme Vulnérable (le Perroquet Jaco *Psittacus erithacus*). Avec ces additions, la liste pour le parc s'élève à 298 espèces. Ces résultats soulignent la nécessité de poursuivre les prospections sur le terrain afin d'améliorer les connaissances de l'avifaune de ce hotspot de la biodiversité.

**Summary.** A brief bird survey of eight days was carried out in July 2013 along the Noumbi River, within Conkouati-Douli National Park, an Important Bird Area in south-west Congo-Brazzaville. In total, 78 species were recorded, eight of which had not previously been observed in the park; one of these is classified as Vulnerable (Grey Parrot *Psittacus erithacus*). With these additions, the bird list for Conkouati-Douli National Park currently numbers 298 species. These results highlight the need for further field work to improve knowledge of the avifauna of this biodiversity hotspot.

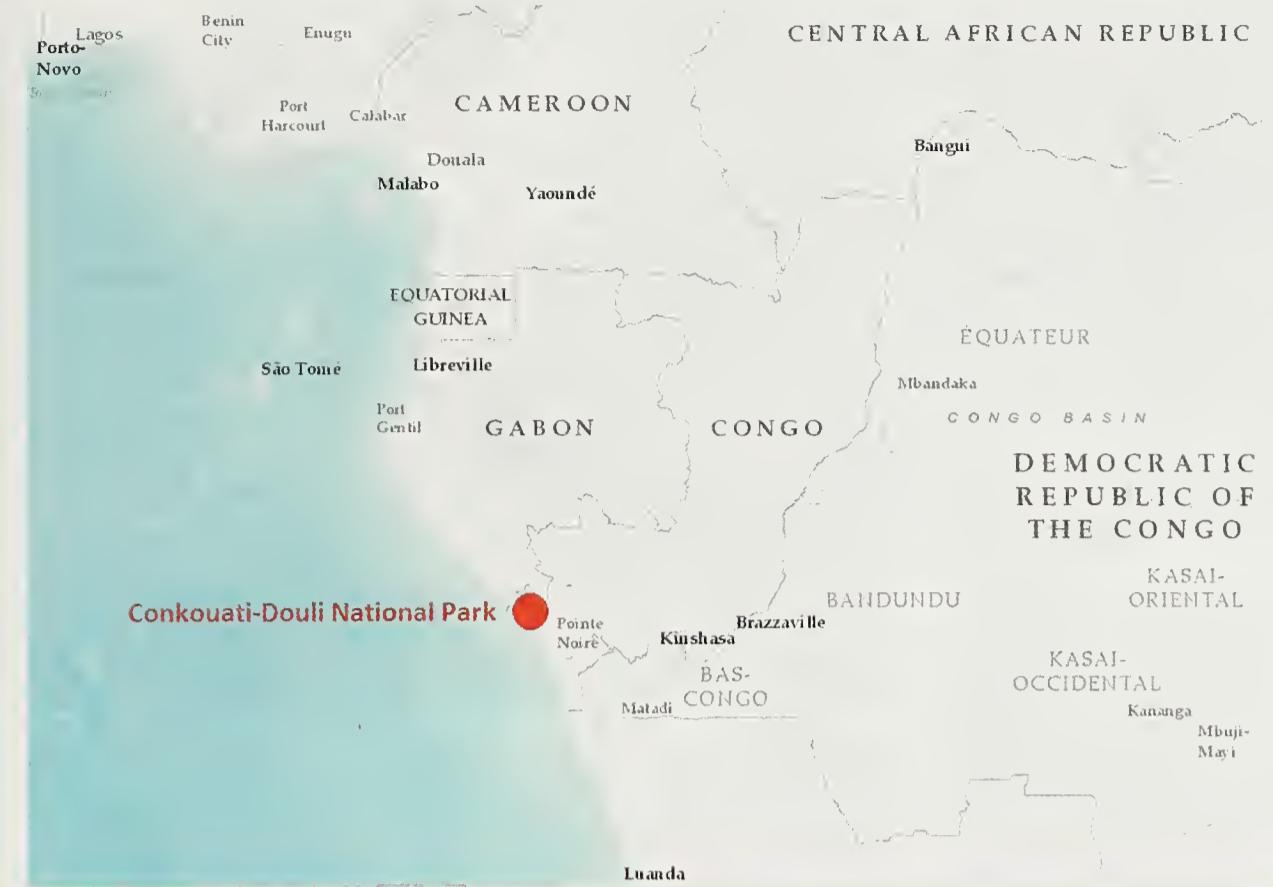

The avifauna of the Republic of Congo (Congo-Brazzaville) remains incompletely known, partly due to the lack of resident ornithologists (Dowsett-Lemaire 2001). Moreover, political instability and violence in the 1990s have not encouraged birders to visit. At present, the country checklist includes 664 species with confirmed records (Dowsett *et al.* 2016).

Incomplete knowledge of the avifauna is particularly true for Conkouati-Douli National Park (CDNP), in the south-west (Fig. 1a). CDNP was gazetted as a faunal reserve in 1980 and classified as a national park in 1999, by Executive Order No. 99-136. The park is managed by the Ministère de l'Economie forestière et du Développement durable, in partnership with the Wildlife Conservation Society. Very few bird surveys have been undertaken in the area: the only efforts known to us are those of Hecketsweiler & Mokoko Ikonga (1991) and Doumenge (1992), who reported on species recorded opportunistically in the western and eastern parts of the park, respectively. There are also unpublished reports of a brief survey in October–November 1996 (Cruickshank c.1997) and on occasional waterbird censuses at the lagoons (Mokoko Ikonga 2007). Additionally, Dowsett-Lemaire & Dowsett (1989, 1991) carried out bird surveys in the nearby Kouilou River basin. Although monitoring programmes are operated by governmental bodies and NGOs for several natural resources (fisheries, oil extraction)

and taxonomic groups (sea turtles, cetaceans, large terrestrial mammals) at CDNP (Devers & Vande weghe 2006), the avifauna has received relatively little attention to date and clearly merits further field work (Rainey *et al.* 2009).

F. Dowsett-Lemaire (*in litt.* 2016) compiled a tentative bird list for CDNP based on the surveys presented by Hecketsweiler & Mokoko Ikonga (1991), Doumenge (1992) and especially Cruickshank (c.1997), of which only the list of species restricted to the Guinea-Congo forest biome has been published (Dowsett-Lemaire 2001). Dowsett-Lemaire (2001) commented that the number of confirmed species (288) was undoubtedly below the potential (probably  $>400$ )—the better surveyed Lower Kouilou basin, which has several habitat types in common with, and only half the surface area of CDNP, harbours 378 confirmed species.

CDNP has been recognised as an Important Bird Area, based on the presence of a breeding population of Rosy Bee-eaters *Merops malimbicus* and of 117 of the 200 species restricted to the Guinea-Congo Forests biome recorded in Congo-Brazzaville (Dowsett-Lemaire 2001). Additionally, CDNP lies within the Secondary Endemic Bird Area ‘Gabon–Cabinda Coast’, which includes the distribution of Loango Weaver *Ploceus subpersonatus*, a restricted-range species (Bulens & Dowsett 2001). Finally, it was proposed as a Ramsar Site of International Importance (Heath

**Figure 1.** Location of Conkouati-Douli National Park (left) and of the study area along the Noumbi River within the park (below), Congo-Brazzaville.

2002) on the basis of a breeding population of African River Martin *Pseudochelidon eurystomina* (Maisels & Cruickshank 2000), a Data Deficient species, despite the fact that on the central African

coast this martin is not water-dependent but breeds in dry sandy savannah.

This paper presents the results of a brief bird survey along the Noumbi River, in the eastern section of CDNP. At this location, a

project to reintroduce previously captive Mandrills *Mandrillus sphinx* into the wild has been undertaken since 2012 by the Jane Goodall Institute. The bird survey was part of wider fauna and flora inventories, aimed to gain knowledge of the biodiversity and environmental features of the forest area where Mandrills are to be released.

## Study area

CDNP is situated within Kouilou administrative region, the south-westernmost part of Congo-Brazzaville (Fig. 1). The park lies between 03°23'–04°18'S and 11°06'–11°43'E. It is limited to the north and west by the international border with Gabon, to the east by the lower Kouilou basin, and to the south by the Atlantic Ocean (Fig. 1). It covers 505,000 ha, 75% of which is terrestrial, from sea level to c.600 m on the Mayombe massif, in the north-east. Non-marine habitats include coastal and tall-grass savannahs, lagoons and rivers, and forests. CDNP's tropical forests, which form part of the Lower Guinean block, account for 73% of the land surface and comprise mangroves, littoral and sublittoral forests, and swamp and semi-evergreen rainforests. Together with the neighbouring Gamba-Mayumba ecoregion in coastal Gabon, CDNP is regarded as a critical hotspot for biodiversity in West-Central Africa, based on the richness of its flora, the large mammal populations (including African Manatee *Trichechus senegalensis*, Forest Elephant *Loxodonta africana cyclotis*, Central Chimpanzee *Pan t. troglodytes*, Western Lowland Gorilla *Gorilla g. gorilla* and other primates and ungulates) and sea turtle breeding sites (Devers & Vande weghe 2006).

Human population density in and around CDNP is low, but pressure on natural resources disproportionately exceeds local demands. Several logging concessions have operated in recent decades, even following the park's creation. Apart from changing the structure and composition of the forest, mining and logging activities have facilitated human exploitation of other resources. Hunting and bushmeat trade are major conservation concerns and are thought to be reducing populations of medium-sized and large mammals at an unsustainable rate (Wieland 2008), provisioning the metropolitan area of Pointe-Noire (c.1,000,000 inhabitants). In general, birds are not the primary target of such hunting activities, at least not in forest tracts more

distant from villages (Hecketsweiler & Mokoko Ikonga 1991).

The Noumbi is one of the largest rivers in southern Congo-Brazzaville, after the Koilou. It meanders through the eastern sector of CDNP, successively traversing Mayombe forest, the forest-savannah mosaic and the coastal forests and shrublands near the river mouth. Our field work was carried out along a 6 km-long stretch in the middle section of the river (04°01'S 11°37'E). Here the riverbed is 15–20 m wide, lined by a narrow strip of secondary gallery forest (Fig. 2), temporarily flooded and dominated by *Raphia* spp., *Berlinia* spp., *Alstonia congensis*, *Uapaca heudeletii*, *Coelocaryon botryoides*, *Guibourtia* spp. and *Sclerosperma mannii*. This gallery is embedded within a 2–4 km-wide dense transitional rainforest between the pure Mayombe and sublittoral forests, giving way to patches of savanna (Hecketsweiler & Mokoko Ikonga 1991). The current zoning of the park includes this area as an 'ecodevelopment' sector, where fishing and gathering of non-timber forest products are permitted (Weiland 2008). The closest permanent human settlement is 20 km away, but there is regular activity by fishermen in the area.

## Methods

Bird species were recorded on a fixed itinerary of 4.6 km along the Noumbi River. As there are no terrestrial routes in this part of CDNP, we used a small rowing boat (pirogue). The field team consisted of three people, two scanning the riverside and canopy, and noting observed species, and the third directing navigation. The boat was paddled at a very low speed (2–3 km/hour), and frequent stops were made to identify passing flocks, bird parties or particular individuals under difficult light conditions (birds high up in the canopy or in the shade). Each survey began in the morning (at c.09.00 hrs) and lasted until the afternoon (14.00–15.00 hrs). Each day, we made short walks from the riverbank into the adjacent forest, using paths made by fishermen and small clearances created by elephants (Fig. 3). The same itinerary was followed every day, upstream first and downstream subsequently, and was repeated daily between 17 and 24 July 2013. We did not count the number of birds, but a relative index of species abundance was inferred based on the daily frequency of occurrence.

Birds were mainly identified visually, using Borrow & Demey (2001, 2010). Occasionally, photographs of individual birds were taken, the identification subsequently being confirmed with the aid of online image databases (<http://www.africanbirdclub.org/afbid/>; <http://ibc.lynxeds.com/>). We did not rely on vocalisations alone for identification.

## Results and Discussion

We recorded 78 species, of which eight are additions to the avifauna of CDNP and 50 (64%) are restricted to the Guinea-Congo Forests biome. All of these are shown in Appendix 1, with the complete (previously unpublished) checklist for CDNP prepared by F. Dowsett-Lemaire (*in litt.* 2016) and two recent updates (see below).

Grey Parrot *Psittacus erithacus* (classified as Vulnerable) was fairly abundant in gallery forest, where a communal roost of c.100 individuals was located. During the daytime the flocks dispersed into the forest, where the species' presence was much less apparent. The population of this parrot in Congo-Brazzaville might be stable, although local declines attributed to trapping activities have been reported here (Martin *et al.* 2014) and in neighbouring countries (Hart *et al.* 2016). Hartlaub's Duck *Pteronetta hartlaubii* was irregularly encountered; this species, which was previously considered Near Threatened (Stattersfield & Capper 2000), has been downgraded to Least Concern due to its large range and estimated global population size above the criterion threshold, although major declines have been reported in West Africa (BirdLife International 2016). Rosy Bee-eater *Merops malimbicus* was observed once: a group of ten in flight over the river on 17 July. Maisels & Cruickshank (2000) discovered a colony of 1,000–1,500 birds in the coastal sector of CDNP. Although the species is not classified as globally threatened at present, the distribution of its breeding colonies and its conservation status are poorly known (Fry & Kirwan 2016) and better knowledge may lead to its reclassification. Several Banded Prinias *Prinia bairdii* (Fig. 5) were observed at small clearings created by elephants in the forest–river contact strip, on 23–24 July. The species was apparently not known previously from CDNP and distribution maps show a small gap in

south-west Congo-Brazzaville and coastal south-east Gabon (e.g. Borrow & Demey 2014).

Dowsett-Lemaire (2001) reviewed the available data and compiled a list of 288 species, based almost entirely on the survey by Cruickshank (c.1997), who identified c.265 species. Additional species were taken from Hecketsweiler & Mokoko Ikonga (1991) and Doumenge (1992), who produced much shorter lists with a higher proportion of errors (Dowsett-Lemaire *in litt.* 2016). Since then, two additions have been published (Marsh Sandpiper *Tringa stagnatilis*: Rainey *et al.* 2009; Great White Pelican *Pelecanus onocrotalus*: N. Honig in *Bull. ABC* 20: 97). The results of our brief and local survey suggest that the CDNP bird list is still far from complete, and that the park deserves more extensive field efforts.

## Acknowledgements

Françoise Dowsett-Lemaire kindly made her unpublished checklist for CDNP available to us. Comments by Ron Demey, Françoise Dowsett-Lemaire, Bruno Portier and Hugo Rainey greatly improved the draft. Invaluable help was received from the staff of the Jane Goodall Institute in Congo-Brazzaville, with special thanks to Debby Cox, Noel Kiyindou, Fernando Turmo and Miles Woodruff. Laura Mari and Eduard Sanz were excellent teammates during the field work.

#### Appendix 1. Bird species recorded in Conkouati-Douli National Park, Congo-Brazzaville.

(Dowsett-Lemaire 2001 and *in litt.* 2016, with a few additions from Rainey *et al.* 2009, Honig *in Bull. ABC* 20: 97 and this study).

Species recorded along the Noumbi River in July 2013 have a coded encounter rate; additions to the list are denoted \*.

Sequence and taxonomy generally follow Dowsett *et al.* (2016), with a few amendments (cf. Borrow & Demey 2014).

**Status in Congo-Brazzaville** (Dowsett *et al.* 2016): R = resident; B = breeding confirmed; M = intra-African migrant; P = breeds in Palearctic; W = winters (non-breeding season); V = vagrant.

**IUCN threat status** (BirdLife International 2016): VU = Vulnerable; NT = Near Threatened; DD = Data Deficient.

**Biome:** GC = restricted to the Guinea-Congo Forests biome (Dowsett-Lemaire 2001).

**Encounter rate:** c = common or fairly common (encountered several times per day or on most days); u = uncommon (irregularly encountered); r = rare (rarely encountered).

**Annexe 1. Espèces d'oiseaux observées au Parc National de Conkouati-Douli, Congo-Brazzaville.**

(Dowsett-Lemaire 2001 et *in litt.* 2016, avec quelques ajouts de Rainey *et al.* 2009, Honig *in Bull. ABC* 20: 97 et cette étude).

Les espèces observées sur la rivière Noumbi en juillet 2013 ont un taux de rencontre codé ; les additions à la liste sont marquées d'un \*.

L'ordre et la taxonomie suivent en général Dowsett *et al.* (2016), avec quelques changements (cf. Borrow & Demey 2014).

**Statut au Congo-Brazzaville** (Dowsett *et al.* 2016) : R = résident ; B = reproduction confirmée ; M = migrateur intra-africain ; P = espèce nichant dans la région paléarctique ; W = hivernant (en dehors de la saison de reproduction) ; V = espèce occasionnelle.

**Statut de conservation IUCN** (BirdLife International 2016) : VU = Vulnérable ; NT = Quasi menacé ; DD = Données insuffisantes.

**Biome** : GC = confiné au biome des forêts guinéo-congolaises (Dowsett-Lemaire 2001).

**Taux de rencontre** : c = commune ou assez commune (notée quotidiennement ou presque) ; u = peu fréquent (irrégulièrement notée) ; r = rare (rarement notée).
